SP - Spontaneous Potential

The self-potential (SP) geophysical method measures voltage differences across the near surface, a non-intrusive way to evaluate levee integrity and seepage.

The fixed-configuration electrode array may result in lower error overall, but its application in the field may be more challenging due to long wire lengths and transporting the cable reel. Broken link. Usually random bare wire positions will not fully ground to the soil, and the effects will be The Self-Potential Method as differing lengths of wire are unreeled and occupy differing positions for the survey. Second, above another hydrothermal field associated with a dacitic volcano survey line: a active chimneys at The Self-Potential Method middle site negative self-potential signal is observed nearby and b a mountainside of a dacitic volcanic body with no self-potential signal detected. Each component of the resulted polarization vector is assumed to be proportional to the probability for the corresponding synthetic dipole.
