It suggests genes aren't the only factor influencing the development of schizophrenia. They range from mild side effects such as dry mouth, blurred vision, constipation, drowsiness and dizziness which usually disappear after a few weeks to more serious side effects such as trouble with muscle control, pacing, tremors and facial ticks. What Really Causes Schizophrenia research has suggested that a greater than average number of structural variations such as rare deletions or duplications of tiny DNA sequences within genes known as copy number variants are linked to increased risk for schizophrenia, especially in "sporadic" cases not linked to family history of What Really Causes Schizophrenia, and that the genetic factors and developmental pathways can thus be different in different individuals.
